

UNIFACE 10

Enterprise Edition

All Uniface's traditional strengths plus a totally new integrated development environment that makes teams even more productive

With Uniface 10 Enterprise Edition, your company can tackle the key challenges of enterprise application development:

- Meeting the continuous requirement for increased productivity, without sacrificing quality.
- Easing the challenge of resource availability by eliminating the need for cross training development resources.

Long-time Uniface customers and new customers alike can transition to the platform seamlessly given its intuitive user interface (UI). Both groups are welcoming its modern look and feel and enhanced productivity features:

- A shorter time to market for new Uniface applications, and faster, more efficient maintenance of existing ones.
- No “technology break” – existing applications can be migrated to Uniface 10 simply by importing the code, the same as with all our previous versions.
- Uniface 10 is “made by developers for developers.” Our development lab has put a lot of thought and hard work into making sure it does what application developers really need.

Uniface 10 Enterprise Edition: Model-Driven Development with a New IDE

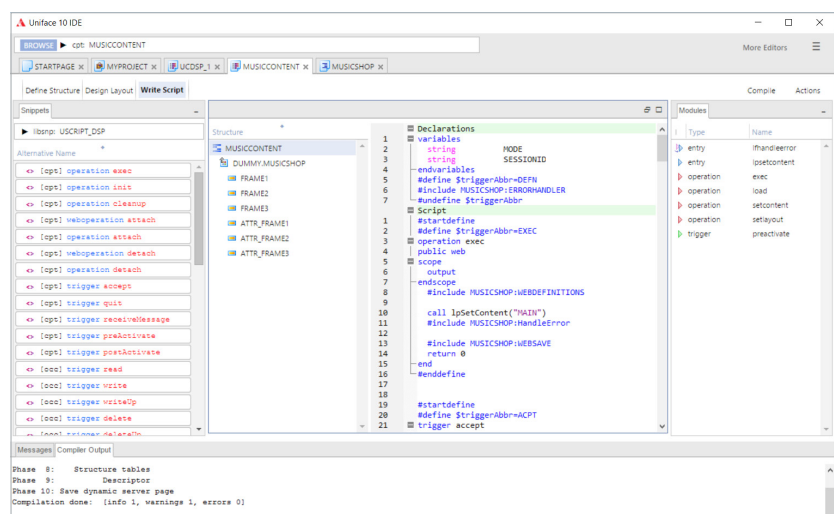

Uniface 10 gives you and your developers all the functionality and benefits of previous versions of Uniface, such as the model-driven development concept, combined with a totally new, leading-edge integrated development environment (IDE) that's even more productive to use. Great new features include:

Everything you need to modify an application, in one place. Instead of repeatedly drilling down to find individual elements that need to change, developers can see all the relevant information on one screen and can update everything at once. You'll be amazed how much time it saves.

All-round convenience. We've standardized and streamlined existing features like handling triggers and libraries. Developers get a really usable, productive working environment. End-users get applications that are simply stunning, both visually and functionally. And all this is true for every platform: client/server, web-based or mobile.

The new Uniface 10 IDE

What's gone into Uniface 10?

A lot of hard work! This was an enormous project, and our team rallied to re-engineer and rebuild the development environment virtually from scratch in record time.

Expert advice. Third-party experts like user interface (UI) psychologists have helped us ensure our IDE reflects the latest design principles and is user friendly, visually exciting, and functionally up to date as other widely used IDEs.

All our existing development functionality. For ease of transition, Uniface 10 includes all the developer functionality of Uniface 9, built up over 30 years.

Ideas from Uniface developers. We've focused on the IDE areas that our user community has told us are most important to them, and that have the greatest effect on productivity and ease of use.

Valuable help from our customers. People who first developed their applications 25 years ago can smoothly migrate those applications to Uniface 10, thanks in part to some customers who have already migrated their applications.

We use Uniface already – why should we get excited about Uniface 10?

Amazing new features. Uniface 10 includes a host of features, such as code hinting, added to the familiar Uniface benefits that you already know and love.

Building on what's there. As well as the new features, you'll also notice improvements to Uniface's existing usability and productivity features.

Happy, productive developers. Your Uniface developers will quickly become more productive – and get more satisfaction from their work. We've been using it in-house for a while, and our developers aren't keen on switching back to the previous version.

Flexible migration. You might decide to migrate a couple of applications first and leave the rest in Uniface 9 while you retest. You could just develop new applications with Uniface 10 and then migrate the rest when you're ready. It's easy to have Uniface 9 and 10 running on the same hardware platform by partitioning it into virtual machines.
